Conversion: MARC → RiC

MARCXML to RiC This is a converter from MARCXML to Records in Contexts (RiC). Overview The mapping is done in the following steps: 1. Download some MARCXML files, eg. from https://catalog.loc.gov/ 2. Put them into the input-folder. 3. Open a terminal and start the conversion with ./run.sh 4. The XML files are converted to RDF and stored as TTL files in output. Mapping with rml.io For the definition the mapping from MARCXML to RiC, RDF Mapping language (RML) is used. Writing RML is made easy with Zazuko XRM. XRM is a great help for creating, adapting or refactoring RML-mappings. This converter was originally developed for MARCXML coming from Patrinum, but thanks to XRM it can be easily adapted and used for other MARCXML-data sources if needed. The processing itself is done with CARML as RML engine. Development The converter was developed in 2021/2022 as part of a SWITCH Innovation Lab. The goal was to map

https://github.com/wildit/marc2ric

metadata from Patrinum to the Connectome ecosystem.

Records in Contexts

un modèle descriptif flexible et interopérable

RiC est un standard ouvert

- A fait ses preuves dans les archives en Suisse
- Cas d'interopérabilités pratiques réalisés (PTTArchiv, P10...)
- Semble adapté pour bibliothèques et musées (préservation)
 - **Usage de RiC croissant en Suisse :-)**
